3 Regression Tables for Racial Resentment Models

Table A3 presents the regression results for the racial resentment models using OLS. Table A4 presents these results using a logistic regression. There are fewer observations in these models than in Table 3 in the body of the paper and Table A2 because not every district in the country was home to a respondent to the CES. Although the relationship between racial

resentment and probability of sponsorship is not statistically significant in the upper chamber model after controlling for other covariates ($p = 0.109$) the relationship is substantively large. Taken with the other results presented in the body of this article and the SI, I conclude that racial resentment probably is associated with sponsorship above-and-beyond the other covariates, the statistical nonsignificance of this one coefficient notwithstanding.
